1 Description and Features

ToupTek's Off-Axis Guider (OAG) allows user to guide the telescope to obtain sharp, round stars by guiding in front of filters using unfiltered light in the same optical path as the main imaging camera. OAG helps overcome non-synchronous distortion and provides higher guiding accuracy.

The features of ToupTek OAG are listed below:

- Connection (to the telescope): M48, M54, M68 based on customer's choice.
- Connector (at camera end): M54 x 0.75 (with 20mm extender included)
- Prism size (mm) 10 x 10
- Thickness: 17.5mm
- 6 mm adjustable focus travel distance.
- Compatible with all guiding cameras, whose body diameter is around 31mm.
- Compatible with telescopes with adapter's diameter within 80mm.

2 OAG Operating guide

2.1 Compatibility with guiding camera

For guiding, ToupTek OAG is compatible with all ToupTek GPCMOS series and G3M series guiding camera. ToupTek OAG is also compatible with guiding cameras whose body's diameter is within 30mm.

Figure 2 guiding camera adapter interface

2.2 Compatibility with telescope

Considering the 10x10 mm prism size, we don't recommend you use ToupTek OAG with telescopes whose clear aperture is smaller than M48.

2.3 Compatibility with main imaging camera

Yet it is recommended to use ToupTek OAG with ToupTek Filter Wheel (AFW), and with all ATR3CMOS series cameras, SkyEye series cameras and G3CMOS series cameras. The large clear aperture supports up to full-frame cameras without vignetting.

2.4 Connection to the telescope

ToupTek OAG offers a choice in one of the M48, M54, M68 thread adapters, connected to the telescope.

2.5 Please Note

While adding ToupTek OAG into your optical train, please make sure the prism won't block the camera sensor.

You can use the guiding screw to adjust the guiding camera's focus length. Please make sure the distances from the prism to the main camera and to the guide camera are the same. To ensure the result, it is better to do this during the daytime for the adjustment will be very difficult at night.

3 Assembly guide

3.1 Connect OAG to guiding camera

First, align the prism direction to sensor direction of guiding camera. Both long sides need to be paralleled.

Insert the guiding camera into OAG and tighten the top first screw to lock the guiding camera.

3.2 Connect extender to camera

Locate the 6 screw holes on the camera's adapter and put the 6 M2.5*20 screws through the extender and insert them into the holes on the camera.

Tighten the screws to lock the extender on the camera.

3.3 Connect OAG to extender

Locate the rest of the 6 screw holes on the extender and insert the 6 M2.5*6 screws through the OAG inner 6 screw holes and insert them into the screw holes on the extender, that has already been connected to camera.

Tighten the screws to lock the OAG with the extender

3.4 Connect thread adapter (connect to telescope) to OAG

Locate the rest of the 6 screw holes on OAG and insert the 6 M2.5*6 screws through the thread adapter screw holes and insert them into the screw holes on OAG.

Tighten the screws to lock the thread adapter with OAG.

3.5 Adjust prism position

Make sure the prism in the OAG does not block the sensor. Loose the screw in the top middle of the OAG to loose the prism, then prism can be moved up and down. Find the proper position for the prism then tighten the top middle screw again to lock the prism.

Make sure to tighten every screw mentioned above to prevent light leak.

Figure 3 complete connection between OAG and color camera

3.6 Focus adjustment

In order to focus the guiding camera properly, user can adjust the prism position up or down, and also pull or push the guiding camera. ToupTek OAG also has a built-in helical focuser with 6mm adjustable distance. User can rotate the blue dial to adjust the focus distance and once find a proper position, user simply tightens the screw on the blue dial to lock the position.
